Hello everyone, first, let me introduce our team. This is Xin Gao, and this is Bowen Zhang. My name is Qiang Tong. Our team name is "DeliveryGuys".

Our project is an online food ordering web application.

As you may know, there is a similar website called "yelp.com". Well, in my opinion, "Yelp" is the website focus more on the "review" part. People using yelp can check out how good or bad a certain restaurant is. While our project focus more on the "online ordering" part.

Many big fast food companies, like Papajohns or McDonald's, have their own online ordering website. But some small restaurants may not have the budget to develop their own website. Our website can help finish the online ordering part.

Ok, here is our project's proposal, there will be three types of users:
- Administrator, who can get access to all the data, and it's his job to approve the request of opening a restaurant in our website.
- Customers, who can search for restaurants, sign up/login, add reviews for certain restaurants, add photos, and of course, make order online.
- Shop owners, who can open a restaurant, edit restaurant information, upload menu of his restaurant, and response to the delivery or pick-up request.

Here are some screenshots of our project.

OK, let me show you guys some of the main pages of our project.
The first page is the search page, also you can sign up or login.
And for example, if you search "burger", there will be some restaurants here in Hoboken which serves burger comes out. As you can see, there is also a map showing where these restaurants are.
And if you click on one of these restaurants, you will go the main page of this restaurant. You can the address and telephone and basic description of this restaurant. There is also a map showing where the restaurant is. Here is the menu, you can also see photos of this restaurant.
And there is a link to start your order. If you click here, there will be table coming out, and all the dishes on the menu turn into links, if you click on some of the dishes, you can see there are more and more dishes showing in this table, and there is a total price.

And that is all we have implemented so far. We are now working on the review part and open restaurant part of our project.

Thank you very much!
